

Milestone 3 - Going agent-native.

Goal

Make your tool callable by an agent, not just by a human at a terminal. A user should be able to ask a practical question about their paperwork and get a useful answer back.

Time estimate

45 minutes (recommended, not a hard timebox)

What to build

Choose one access pattern that lets an agent drive your tool:

- **MCP server** - expose your tool through the Model Context Protocol.
- **Claude Skill** - add a skill in `.claude/skills/` that teaches Claude how to use your CLI.
- **Agent-friendly CLI** - provide clear commands and predictable output so an agent can call the tool directly.

Plus: add search

Classification gets PDFs into the right place. Search is what makes the library useful.

Start with something simple if needed. Grep over markdown transcripts counts. Embeddings or a vector database are fine if they fit your foundation, but they are not required.

The important part is that an agent can answer questions such as:

- *"Find the invoice for that gadget from three months ago."*
- *"Which bills are overdue?"*
- *"Show me documents from Stadtwerke."*

Search is the first of many tools you might give the agent. Before you build more, list what would come next. That list will tell you whether your architecture is holding up.

Acceptance criteria

- Your tool is callable by an agent via at least one access pattern (MCP / Skill / CLI).
- An agent can run a real query against your library and return a useful answer.
- The interaction is demonstrable live.

Guidance

- MCP is allowed even if you are new to it. Keep the scope small and expose one or two useful operations.
 - A clean CLI counts as agent-native. Agents are good at using CLIs when commands are explicit and output is structured.
 - User-facing polish is optional. Agent access is the point of this milestone.
-

Milestone 3 passes if

- the tool exposes at least one agent-callable access pattern
 - search exists in some form (grep, embeddings, vector search - your call)
 - an agent can demonstrate a real user query end-to-end
-

Bonus work

Bonus milestones stay optional and looser. Good directions include **supporting more file formats, adding more agent tools, or building a human-friendly interface** on top of the core flow.
